

11/11/11

countries will be taken out of the export market to satisfy local demand. The problem gets worse when impositions towards avoiding the use of fossil fuels are actually implemented. All possible sources of energy that show a mature and feasible technology will need to be employed, particularly nuclear

7. Conclusions

The analysis of sustainable energy supply in developing countries faces the challenge imposed by the huge increase of their population and the need to satisfy their expectations for significant quality of life improvements. Abundant energy supply is relate
